

florida cool ring Assembly

figure 1

Open bundle; allow rings to expand and loosen; remove the outermost *florida cool ring* from the bundle. Assembly time is approximately 10-15 seconds.

Each ring has a "head" (where the wire extends beyond the fabric side) and a "tail" (where the fiber is longer than the wire). For ease of demonstration, place the "tail" in your left hand and the "head" in your right. The *florida cool ring* will naturally begin to take the form of a circle. (see figure 1)

figure 2

Place the "head" over the "tail" flap so one set of lateral bars on the wire is perfectly overlapped.

Using the C-clip gun (P7 model), attach the two ends of the wire ring in four places down its side. Placing the C-clips in this procedure initiates holding the ring's circular form in place. (see figure 2)

P7 Model C-clip Gun

figure 3

On both the top and bottom of the *florida cool ring*, place one C-clip where the overlapping occurs. (see figure 3)

figure 4

Place the "tail's" loose fabric back against the wall of the container and attach it to the wire at both the top and bottom. These C-clips will be attached through two pieces of fabric and only one piece of wire. (see figure 4)

Place the *florida cool ring* on the center of the non-woven fabric bottom and partially fill with soil to begin the planting process. (see figure 5)
